

## ABSTRACT

5           The invention provides a new universal bonded phase material  
used for separation of a wide variety of organic and inorganic  
10           substances by liquid chromatography. The material is produced  
by bonding a charge-bearing hydrophobic functional group to  
the surface of a supporting material. The process of preparation  
15           of such material and advantages of using the material are  
described.
